Need to have a portal for target definition.What is
Account team will have an assessment form better to do the assessment. Then based on bg's ah view, they will have a target definition form for each account like ah 3rd is account team will have a form to report produced by monthly or quarterly maturity progress.Ah intervention progress.These three are from the account side. Now account team also provide other data. If it is available through systems, it will take automatically. For example, CRM um opportunities related to AI with the CRM, um integration or.Etc. 5th point of view. Yay. Sessions happened with the customer, then pocs pots we are pursuing with customers, right? Ah next ahKey customer connects.So these are the data we'll be collecting from accounting will provide in in a shape based on the template. These are the things that they are providing either quarter monthly, quarterly or ah.Set frequency, set frequency and also talent data distinguished.

Um how many distinguished engineers so talent data.Which is uh FDE, testing, test engineers, etc. And also we will integrate with ah iwall, integrate with iwall in terms of how many people are in the account trained on E 0 E one E two E 3 system report.This is talent FDA focused. This is if if company is putting a mandate that everyone has to be even certified, then this data will tell.Towards that company mandate what percentage you are compliant with so that is ie volume integrationWith that, then how many personas CEO is final? Sorry CEO, CEO, CEO, CEO. Executives. But okay. CEO OCOO. Final personas. Final persona COCO consumption of all this data. Finally intermediate then you love.Um ah yeah and so this team is there between these two teams, even the bgisu leader.AI leader. Okay then then I'll put like this bga leader on persona. I see a leader, ISUA leader. Ah.So that now the subway and the aea champion, these all the people who would be actually driving and doing the actual activity now account champion is responsible or the person whom he will update his delivery head.Okay, ISUAI leader will be too ISU head to bg head for the respective bgs so account. All accounts in the isa will be consolidated by isu person. All is's in the bg by bg person. All of these bg's isu everything by aisd to cx.So, so, okay, now that means we have so many personas coming in now, right? So it is.Are very similar. And I assume a leader under bja leader only the span varies. Otherwise the responsibility wise, it is largely very similar. Ah this this is more immediate reporting executive level, the end consumer and the higher senior leadership or the consumers, they are the producers.Let's send these people are aggregators and ownership for their span of country. Agree, agree. So actual we are trying to simplify the work of all these people, including these people in the account team and consumers of information, consumer ah producers, integrators and consumer.Producer, integrators and consumers. This flow is mostly similar for different service lines like AD, like am, like ah qe, but yeah service line 6 very similar. Once you do the streamlining for one service line only, this data points will change.Yeah otherwise this whole flow will remain exactly the same for all of them. It will also give you another benefit of an integrated account view across service line right, right, good. And another thing is same while we are talking about AI service autonomy and AI related data for any data collection, anything.Related to the account, this is the way only thing it would be, dEG or cso so.

Other thing is if delivery hit wanted to look at their account ah data in a very structured way, identify the gaps and advice, and then this information.Will be presented in a way that dh can consume rather than excel script. Right. Ah which could be an ah RR. They can even upload a raw excel like with you with the using AI, we can even partner at that. Correct? Ah that's what I'm telling. How what level of insight is required for dhr to action on those interv?For example, if something is not moving, this insights will give him a way that he can consume it easily. Currently it is excel. I don't think he's going to go through all the rows. So so persona wise we have a lotSome reasons. Let's summarize what we discussed. So what we are discussing is AI, so um service autonomy, level of AI for each of the accounts, which is like L one 2, l two, l 3, l 4, l 5, which level each of the account is currently. So the first thing we talk about is the assets.Assessment, first time assessment will help to baseline the account autonomy level, AI service autonomy level. Once that is captured then we will be talking about the targets. Each account iso is bguis, they will be having a target for autonomy level. Maybe they are at L one they want to go to.L 3 by Q two or Q 3. So quarterly target will be there. And ah to achieve that target of level movement, the accounts have to come up with a 30, 60, 90 day plan. They might be doing some workshop, they would be participating in some ah discussions and focused group connects and all.And they come up with a plan. Once the plan is ready, then they have to track the implementation as per the plan. So every 30 days, whether they have done something or not, depending on different phases, for example application development, they might be doing something great in requirements. They are able to move one level for requirements.Then we have to validate whether they are in a position to reassess. Is it a time to reassess? So that is one aspect. Essentially this part is 30, 60, 90 day plan implementation, moving one level up, doing a reassessment at an appropriate time.The other set of things, apart from AI service autonomy level, we also collect data in terms of deals won, which will come from systems like CRM, um ah what stage the deals are in, whether it is a proactive deal or it is like customer driven deal.Then there will be the key customer connects. We will talk about how many customer connects happened, what type of customers is it cxo level or vp level or any other level? And what kind of context is it like poc PO ts or PO vs? What are we talking? So that is one data. Another one is talent data.In terms of if these number of ftes, number of distinguished engineers, and also integrating with ah ie world system to get the competency level of number of people E 0, e one, e two E 3, in AI competency, these are all the set of data which we will collect.Now this entire set of data is given by the account team, ah is given by the accounting. So we need to see how are we going to simplify the process of collecting the data or giving the data to the account team so they don't feel it is overburdened. Now, this account is collected by account.Account level and they maintain a report which they will be sending it to their delivery head on a weekly basis or a monthly basis. Now every account in the eso that will be collected by the isu AI leader, where the isu AI leader collect all the account data, then put a isu level summary.Delivery to the isu head on a periodic basis. The next level is the bg AI leader who will collect all the isu data and consolidate, and he will prepare a periodic ah report for the bg head.Now all of this account ISUBG information, the data is collected by, say, the Central core team for each of the service line. They will be preparing a report at a organization level for the cxos, which will go to CEO or COO or the appropriate stakeholders. It can, it also goes.Ah the bee gee heads at the organizational level. So we talk about producer who are the account teams, integrators who are the account AI champions, isu AI champions and bga champions, and consumers who are the leadership team at a different level. I as you head bg head cxos, all of them.Talk about
